

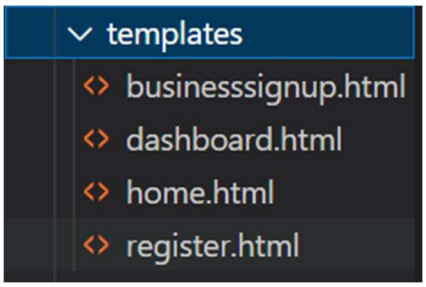
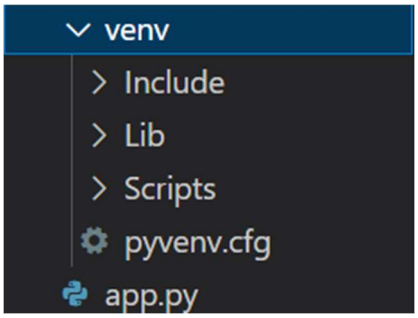
The Finder is a job search website that allows people to search and find their dream jobs or life career. On the homepage of the website one can join as an employer, another person can join individual and if you are already a member you can simply login to be able to access your dashboard. The second image is when you scroll down, here you will see jobs which are currently for people to occupy various positions.



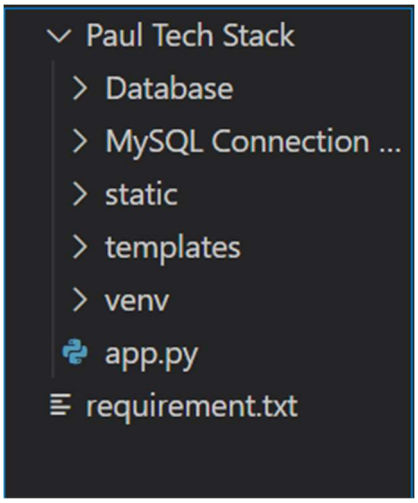
This is the template folder and it four HTML files in it. The businesssignup.html is the code for business registration form. The dashboard.html is the dashboard where people can see their account and navigate through it. The home.html is the main homepage of the website. The register.html is the registration form for individuals to sign up.



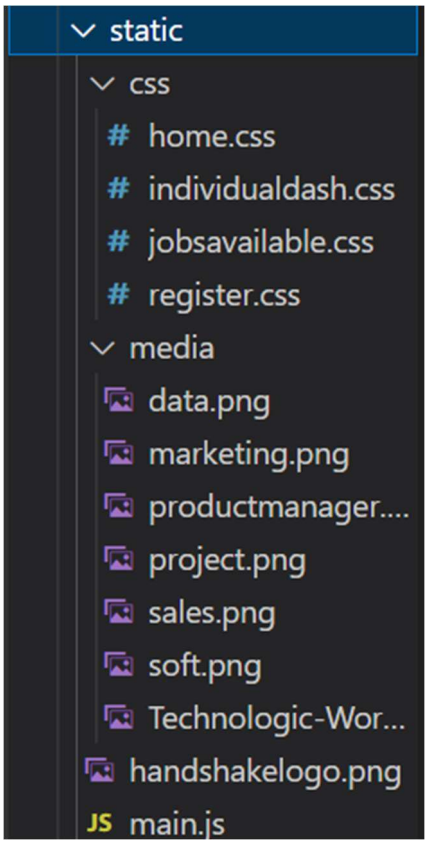
This folder is the virtual environment. The following steps are the process of creating an environment.

You must create a project folder and then you `py -3 -m venv venv` copy or type this in your terminal.

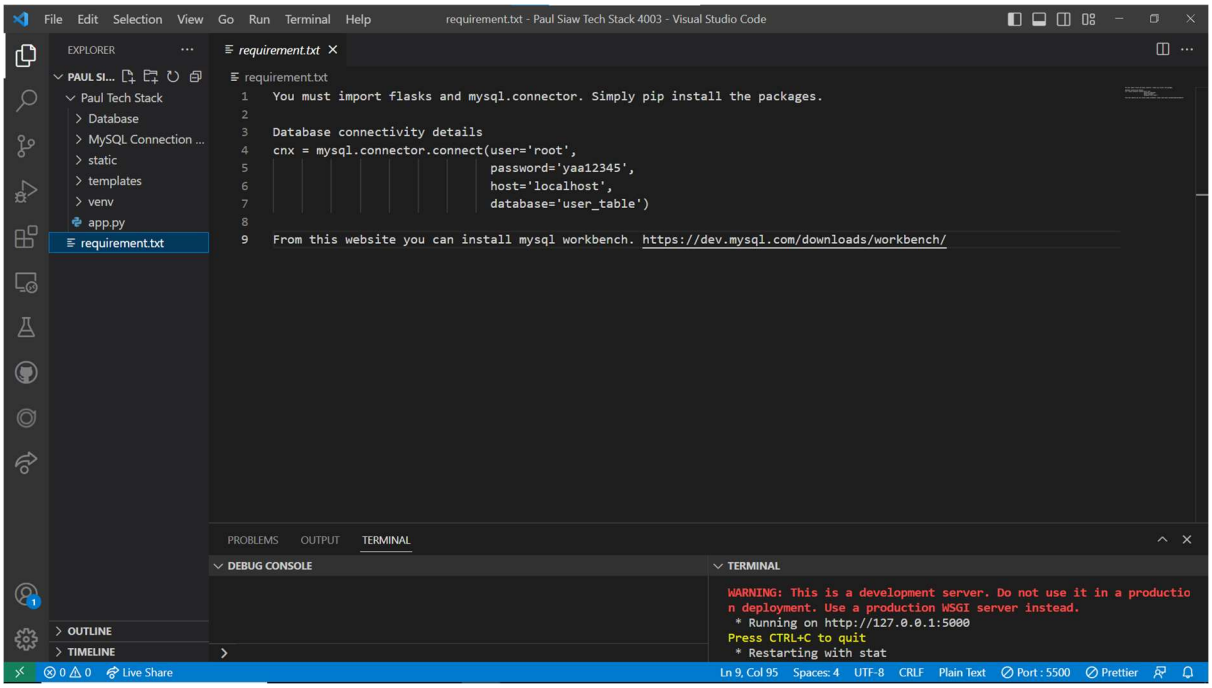
To know whether it has successfully installed navigate through these folders.
`venv\Scripts\activate`



This is the project folder and in it you can see the app.py which was used to link all the page to the database.



The static folder contains CSS folder and its files for each of the HTML files. Also, the media folder which contains the images of the website and the JSON file.



This is the requirement.txt file that explains one or two things which would help someone to use this project.

This is my GitHub repository: https://github.com/2123098/Paul-Siaw-4003.git
